Editing Mastercam 9 Post Processors: A Step-by-Step Approach

Mastercam 9 provides a dedicated editor for post-processor modification. While the specifics might vary slightly depending on your Mastercam 9 version, the general approach remains consistent. This process involves careful study and testing:

1. **Locate the Post Processor:** Find the appropriate post processor file (usually a `.pst`` file) within the Mastercam installation directory.
2. **Open the Post Processor in the Editor:** Mastercam provides a built-in text editor designed specifically for post processor modification.
3. **Understand the Post Processor Structure:** The post processor is composed of various sections controlling different aspects of the G-code generation. Common sections include header information, tool change routines, feedrate settings, and miscellaneous functions.

4. Make Modifications Carefully: Any changes should be made cautiously and with a thorough understanding of their implications. Small errors can lead to significant problems. Use comments liberally to document changes.

5. Test Thoroughly: After making any modifications, rigorously test the updated post processor on a simple part before using it on critical projects. Simulate the toolpaths and carefully review the generated G-code.

6. Iterative Refinement: Post-processor tuning is often an iterative process. You may need to make several adjustments and test runs to achieve the desired outcome. Documentation and version control are crucial during this process.

7. Best Practices: Always back up your original post processor before making any modifications. This ensures you can revert to the original if necessary. Use meaningful variable names and consistent formatting to maintain readability.

Advanced Post Processor Techniques in Mastercam 9

Beyond basic edits, advanced techniques allow for greater control and customization:

- **Conditional Statements:** Employing conditional statements (e.g., `IF-THEN-ELSE` structures) allows for dynamic G-code generation based on various factors like tool type or machining operation.

- **Custom Macros:** Creating custom macros enables the reuse of commonly used G-code sequences, improving consistency and reducing errors.
- **User-Defined Variables:** Utilizing user-defined variables allows for easy modification of parameters without directly editing the post processor code.
